

For next iterations – Changes to be reflected – Jul 17, 2026

Main page (without login or sign-in)

Newly added on main page: How it works page

=====

How It Works

=====

Implement a dedicated "How It Works" page that explains how Sightline evaluates AI Visibility in a way that builds user trust without revealing proprietary algorithms or implementation details.

The objective is to reduce uncertainty, improve credibility, and help both prospective and existing users understand how Sightline generates its insights.

This page should be accessible from the main application (e.g. navigation, dashboard, or another prominent location) so users can easily revisit it whenever they want to better understand their results.

=====

Content Requirements

=====

The page should answer the following questions:

- What does Sightline measure?
- How are results generated?
- What factors influence the AI Visibility Score?
- How should users interpret the results?
- Why can scores change over time?
- What does Sightline intentionally not measure?

The language should be:

- Clear
- Professional
- Transparent
- Easy to understand
- Non-technical
- Confidence-building

Avoid marketing language, exaggerated claims, or unnecessary technical jargon.

Do not reveal proprietary scoring algorithms, weighting formulas, prompt generation logic, infrastructure, or implementation details.

=====

Recommended Structure

=====

1. Overview

Provide a brief introduction explaining that Sightline evaluates how leading AI assistants discuss and reference brands using a consistent and repeatable methodology across prompts, AI models, citations, competitors, and selected markets.

2. How Sightline Works

Present the process as a simple step-by-step flow covering:

- Prompt evaluation**
- AI response collection**
- Response analysis**
- Citation identification**
- Continuous monitoring**

Keep each step concise and focused on what happens rather than how it is technically implemented.

3. What Influences Your AI Visibility Score

Explain the high-level factors that contribute to AI Visibility, including:

- Brand mentions**
- Recommendation frequency**
- Citation coverage**

- Source quality
- Competitive visibility
- Consistency across AI assistants
- Prompt coverage

Do not disclose formulas, scoring logic, or weighting.

4. Understanding Your Results

Explain that AI Visibility Scores are intended to be interpreted as a directional benchmark rather than an absolute ranking.

Help users understand what higher or lower scores generally represent without guaranteeing specific business outcomes.

5. Why Scores Change

Explain that AI Visibility naturally changes over time due to factors such as:

- AI model updates
- Changes to publicly available web content
- Changes in citations and references
- Competitor activity
- New scans over time

Help users understand that AI Visibility is dynamic and continuously evolving.

6. What Sightline Does Not Measure

Clearly communicate that Sightline does not:

- **Guarantee rankings**
- **Influence AI model behaviour**
- **Modify AI-generated responses**
- **Predict future AI outputs**

This helps establish realistic expectations and improve user trust.

=====

Transparency Principles

=====

Include a concise section outlining Sightline's guiding principles:

- **Consistent methodology**
- **Transparent reporting**
- **Evidence-based insights**
- **Continuous monitoring**

Where possible, explain that Sightline surfaces the prompts, AI responses, and cited sources behind its insights so users can understand why a result was generated instead of relying solely on a score.

=====

User Experience

=====

Reuse existing layout components and design patterns.

The page should feel like a natural extension of the product rather than external documentation.

Where appropriate, add contextual links throughout the application, such as:

- "How It Works"
- "How is this calculated?"
- "Learn how Sightline measures AI Visibility"
- "Why am I seeing these citations?"

These links should direct users to the "How It Works" page from relevant areas such as:

- AI Visibility Score
- Reports
- Sources
- Dashboard

=====

Implementation Requirements

=====

- Reuse existing components wherever possible.
- Do not introduce unnecessary complexity.
- Keep the content concise and easy to scan.
- Prioritize clarity over technical detail.
- Protect proprietary implementation details.
- Ensure the page is responsive and consistent with the existing design system.

=====

Objective

=====

The goal is to increase user confidence by clearly explaining how Sightline evaluates AI Visibility while protecting proprietary implementation details.

Users should leave the page with a clear understanding of what Sightline measures, how results are generated at a high level, how to interpret their reports, and why they can trust the insights provided.

Now on pricing, refer to the below images with description:

Current pricing on the main page

The screenshot shows the Sightline pricing page with the following details:

- Header:** Pricing, Log in, Sign up, Get demo
- Section:** Pricing that scales with your visibility
- Plans:**
 - Free:** \$0/month, 1 project, 5 prompts, 5 AI scans, 2 competitors, 1 content gen, 1 trending topic, 1 market benchmark, 1 weekly report, 1 email report, 1 shareable link, 1 team collaboration, 1 white-label support.
 - Starter (\$49/month):** 3 projects, 20 prompts, 50 AI scans, 10 competitors, 5 content gens, 3 trending topics, 3 market benchmarks, 3 weekly reports, 3 email reports, 3 shareable links, 3 team collaborations, 3 white-label supports.
 - Pro (\$149/month):** 10 projects, 100 prompts, 200 AI scans, 50 competitors, 20 content gens, 10 trending topics, 10 market benchmarks, 10 weekly reports, 10 email reports, 10 shareable links, 10 team collaborations, 10 white-label supports.

Pricing to be more concise, tight, think from a prospective buyer (=user) perspective when they review the pricing and the feature, so that the pricing appears to be bang for their buck and can get the job done.

What needs to be included to set the right expectations that leaves no blind spot:

Features	Free	Starter (\$49 / month)	Pro (\$149 / month) = Everything included in starter
Projects (websites/URL)	1	3	8
Tracked Prompts	5	20	50
AI visibility scans	5 total	50 / month	60 / month
Competitors tracked	2	10	50
Content generations (pages, schema, first tat, summary)	5	30 / month	60 / month
Trending Topics		✓	✓
Market benchmarks		✓	✓
Weekly email reports		✓	✓
Shareable report links		✓	✓
Team collaboration (Member: members can run scans and generate content; Viewer: viewers see reports only)		2 seats (viewer only)	5 seats (can be viewer or member access and up to the user to decide within the boundary of seats)
White-label support			✓

Pricing should be consistent:

Current pricing on the main page (before login)

Current pricing on the "billing" page (after login)

pricing on the main page and once logged in need to be consistent to avoid confusion.

Once logged in, the sightline's "billing" page should be a page where the users can see a quick summary of their tier plan and also so they can track and monitor their usage. Below is an example from a competitor on the "billing" page that Sightline should also replicate the "Current plan" only.

Once logged in, the sightline's "billing" page should be a page where the users can see a quick summary of their tier plan and also so they can track and monitor their usage. Below is an example from a competitor on the "billing" page that Sightline should also replicate the "Current plan" only.

=====

AppSumo Lifetime Deal Redemption & Activation

=====

Design and implement the most efficient onboarding and redemption flow for customers who purchase Sightline through AppSumo.

The objective is to make the redemption and account activation process completely self-service, seamless, and require little to no manual support.

The solution should prioritize:

- Simple user experience**
- Minimal engineering complexity**
- Low maintenance**
- Secure redemption**
- Prevention of duplicate or fraudulent redemptions**
- Scalability for thousands of AppSumo customers**

=====

Requirements

=====

Users who purchase through AppSumo should be able to:

- Redeem their AppSumo license.**
- Create a new Sightline account or link the license to an existing account.**
- Have their Lifetime Deal plan automatically activated after successful verification.**

- Complete the entire process without requiring manual intervention from the Sightline team.

The redemption flow should require the fewest possible steps while remaining secure and intuitive.

=====

Lifetime Deal Access

=====

AppSumo customers should be assigned a dedicated Lifetime Deal plan.

This plan should have its own feature limits and entitlements that are separate from the monthly and annual subscription plans.

The implementation should make it easy to update, expand, or modify Lifetime Deal entitlements in the future without affecting other subscription plans.

=====

Engineering Requirements

=====

Before implementing, review the existing authentication, billing, subscription, and user management architecture.

Reuse existing account creation, authentication, subscription, and billing infrastructure wherever possible.

Do not build a separate authentication or user management system for AppSumo customers.

Instead, integrate AppSumo users into the existing account and subscription model while assigning the appropriate Lifetime Deal plan after successful license verification.

The implementation should:

- Minimize operational overhead.**
- Require little to no ongoing manual administration.**
- Prevent duplicate account creation.**
- Prevent multiple redemptions of the same AppSumo license.**
- Handle invalid, expired, or previously redeemed licenses gracefully.**
- Be flexible enough to support future marketplace or promotional partner integrations using the same redemption architecture where practical.**

=====

Research & Recommendation

=====

Before implementing, determine the most appropriate AppSumo integration strategy based on:

- Current AppSumo redemption best practices.**
- The existing Sightline architecture.**
- The project's Engineering Principles.**

If multiple implementation approaches are possible, recommend and implement the approach that best prioritizes:

- Simplicity**

- Low maintenance
- Low infrastructure cost
- Strong security
- Excellent user experience

Avoid unnecessary complexity or custom infrastructure if existing AppSumo capabilities can accomplish the same outcome.

=====

Expected Deliverables

=====

After implementation, provide a summary that includes:

- The recommended redemption architecture.
- The complete user redemption flow.
- All modified pages, components, services, and APIs.
- Any database or schema changes.
- Any billing or subscription changes.
- Security considerations.
- Edge cases handled.
- Any assumptions made during implementation.
- Areas that should be manually tested.
- Future improvements intentionally deferred to preserve simplicity, maintainability, and alignment with the project's Engineering Principles.
